          Peptides R90945-64 are derived from the factor VIII protein, esp. from a modified Factor VIII in which residues Ala322-Ser750, Leu1655-Arg1689, Lys1694-Pro1782 and Asp2170-Tyr2332 are deleted. The modified Factor VIII and derived peptides can be used to prevent the activity of inhibitors of factor VIII binding to von Willebrand factor, esp. antibodies, thus preventing or treating immune disorders.

The present sequence represents amino acids 32-40 of Ras, which comprise the effector loop domain. The effector loop domain binds to amino acids 50-150 (w34649) of the Raf protein. This interaction participates in the transduction of an intracellular signal via the Ras RAf imediated signal transduction pathway which culminates in cell proliferation. A novel method for reducing cell proliferation in a mammal comprises administering to or contacting the cells with a compound which inhibits direct binding of the effector loop domain of Ras with an amino the present sequence. The methods are used to screen compounds for Raf activation inhibiting activity, cell proliferation inhibition and inhibition of direct binding of Ras to Raf. Blocking association of Ras with Raf interferes with receptor-mediated activation of immune cells. The method may also be useful in down-regulating the immune response in patients with autoimmune diseases such as systemic lupus erythematosus, type I diabetes, and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

This represents a Ras-binding peptide fragment of the Raf protein. The Ras-binding peptides especially those shown in W57456 to W57460 can be used in methods of inhibiting cell proliferation on an animal which comprises inhibiting direct interaction of Ras with Raf by administering the peptides. The Raf peptide can be used in methods of evaluating an anti-proliferative compound by contacting the compound with a Raf and determining its ability to bind to Ras. The peptides are useful for treating diseases characterised by disregulated signal transduction or aberrant cell proliferation, e.g. tumours and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding NOEY2 tumour suppressor from ovarian epithelium - useful for, e.g. treatment, diagnosis and prognosis of cancer, particularly cancer of ovary and breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of the effector domain of Ras and Rap family members. A putative effector domain of NOEY2 (see W79898) differs in 3 residues from this sequence. NOEY2 is a novel human tumour suppressor protein that is absent or down-regulated in breast and ovarian cancers. NOEY2 polynucleotides (see V60577-78) and polypeptides of the invention are used in the treatment, diagnosis and prognosis of cancer, particularly of the ovary and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ras-binding fragment of Raf protein Raf(32-40) (residues 32-40).

                                 The present sequence represents a Raf-binding peptide fragment of Ras, from the present invention. The present invention describes: (1) a method of evaluating an anti-proliferative compound comprising contacting the compound with an amino-terminal, non-catalytic Ras-binding fragment of Raf and determining the ability of the compound to bind to the fragment, where the binding ability of the compound is an indication that the compound inhibits cell proliferation; and (2) a method of evaluating an anti-proliferative compound comprising contacting the compound with a Raf-binding fragment of Ras comprising an intact effector loop and determining the ability of the compound to bind to the fragment, where the binding ability of the compound is an indication that the compound inhibits cell proliferation. Antiproliferative compounds identified as above can be used to treat tumours and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A peptide of 5-25 amino acid residues (pref. one of the pentapeptides R37031-3 or an atriopeptin e.g. atriopeptin A or D, see R37337-8) having an activated carboxyl group capable of forming a betaglycosylamine linked glycoconjugate is reacted with an unprotected beta-glycosylamine deriv. of an oligosaccharide. The deriv. is prepared by reacting an unprotected oligosaccharide and enving up to 9 saccharide units with saturated ammonium bicarbonate at pH 8.0-8.5. The N-linked glycoconjugate is produced under conditions to directly maintain the beta-anomeric configuration.

The inventors attempted to sequence the PSM Ag by modified Edman degradation. Peptides (R55098-107) that gave clear dominant peaks on HPLC from the digested PSM Ag sample were used. Some of the residues were unidentified, and others were present at very low residues were unidentified with lower confidence. Some of these peptides were used to design primers to carry out PCR to identify cDNA clones cancoding the PSM Ag. R55100 was used to design primers 065521 and 06552. A clone, IN-20 was identified as a partial PSM sequence. CO5522. A clone, IN-20 was identified as a partial PSM sequence. CO5520. The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. The proceed is useful to identify or purify iligands of the Ag. It is also an attractive target for Ab-directed imaging and targeting of prostatic tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Caps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Prostate-specific membrane antigen and DNA encoding it - 1s useful for detecting haematogenous micro-metastatic tumour cells and for identifying ligands which bind to PSM Ag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

This sequence represents a peptide fragment from a novel STE20-related protein kinases. The invention relates to nucleic acid molecules encoding a kinase polypeptide selected from STLK2, STLK4, STLK5, STLK6, CSTLK7, 2C1, 2C2, 2C3, 2C4, KHS2, SULU1, SULU3, GEK2, PAR4 and PAR5. The proteins are used to identify agonists and antagonists, and to raise antibodies. The polynucleotides are useful in gene therapy protocols. The polynucleotides such as immune-related disorders and agonists may be used to treat diseases such as immune-related disorders and diseases (e.g. crohn's disease), asthma, osteoarthritis, psoriasis, chronic inflammatory bowel disease (e.g. Crohn's disease), asthma, osteoarthritis, psoriasis, atherosclerosis, rhinitis, autoimmuity, and organ transplantation, chronic inflammatory pelvic disease, multiple sclerosis, organ chronic inflammatory pelvic disease, multiple sclerosis, organ chronic inflammatory pelvic disease, multiple sclerosis, organ chronic lateral sclerosis, Parkinson's disease and Leigh syndrome), candioumyopathies, ischemic disorders, inflammatory disorders, cancer, cardiomyopathies, ischemic disorders, inflammatory disorders, diabetes mellitus, fibrotic and mesangial disorders. The proteins may calso be useful for cell growth regulation (e.g. in wound healing), T cell activation, mitosis control, and as immunosuppressants.
                                 Novel kinase-related polypeptides used for the diagnosis and treatment of kinase-related diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunodeficiencies; immunosuppression; T-cell subset; immunotherapy; inflammation; wounds; lymphocyte; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New synthetic immunomodulatory peptide(s) - for treating immunodeficiencies, immunosuppression and T-cell subset deviations and immuno-therapy of infections, inflammation, wounds etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                                 specific membrane (PSM) antigen (see also W02234) and used to closing primers (T36795-808) utilised in the isolation of a cDNA clone (T36785) coding for PSM; primers A and B (T3795-96) are based on amino acids 1-5 of peptide 2T26 3 (W02239). The isolated cDNA and PSM protein are useful in developing methods for the diagnosis and treatment of prostate cancer and metastasis.
                                                                                                                                                                                                                                                 (W02237-45) were obtd. from the human prostate-

```
The sequence is a specific example of a group of new immunogenic peptides having an HLA-A3.2 HLA-A1, HLA-A11 or HLA-A24.1 binding motific. For example, the peptides having an HLA-A3.2 binding motific each have 9-10 residues and contain, from the N-terminus to the C-terminus, (a) a first conserved residue selected from L, M, I, V, S, A, T, F, C, G, D and E and (b) a second conserved residue of K, R, Y, H or F, where the first and second conserved residues are separated by 6-7 residues. The peptides are capable of binding selected MHC molecules and inducing an immune response. They can be used to treat and/or prevent viral infection and cancer, e.g. prostate cancer, lymphoma, hepatitis or AIDS. They can also be used to produce antibodies for use as diagnostic or therapeutic agents. The peptides can also be used as diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogen; HLA; human leukocyte antigen; binding motif; antiviral; MHC; major histocompatability complex; viral infection; anticancer; prostate cancer; lymphoma; hepatitis; AIDS; diagnostic; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide which specifically binds selected MHC allele - used to induce an immune response for treatment or prevention of viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 22; DB 15; Length 9;

                                                The immunomodulatory peptide is a specific example of a peptide cpd. (or an acid or base salt) constructed by combination and/or overlapping of the amino acid sequences AlBINBA2A, ABB3XA4B4, BB5A5XA6B6, BAAXXB8AB, AB99, AlOAll, BIOAL2, and BIIBL2 (x= Ala, Gly, IIe, Leu, Phe or Val, Al-Al2 each= Arg, Asn, Gln, Lys, Phe or Val; B-B12 each= Asp, Glu, Tyr, Phe or Val. The synthetic peptide may be used for immunomodulation of various immunodeficiencies and immunosuppressed conditions, T-cell subset and lymphocyte deviations, enhancement of a vaccines efficacy, as well as for immunotherapy, including infections, local or systemic complications of non-infectious diseases, postoperative inflammations, wounds and burns. These fragments were used to determine the sequence of IRS-1 and to distinguish it from proteins which are co-puried with it. Antibodies were raised against the IRS-1 proteins and were used to remove them from the reaction media. These peptides were formed by proteolytic cleavage of proteins isolated by 1D-SDS PAGE to be approx. 185 kD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Insulin receptor substrate-1; IRS-1; antibody; proteolytic cleavage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Trimery Structures of hypertrehalosaemic neuropeptides isolated from acaded G., Rinehart K.L.

"Primary structures of hypertrehalosaemic neuropeptides isolated from the corpora cardidates of the cockroaches Leucophaea maderae, acompladorhina portentosa, Blattella germanica and Blatta orientalis and of the stick insect Extatosoma tiaratum assigned by tandem fast atom bombardement mass spectrometry.";

Biol. Chem. Hoppe-Seyler 371.345.354(1990).

-!- FUNCTION: HYPERTREHALOSAEMIC FACTORS ARE NEUROPEPTIDES THAT ELEVALE THE LEVEL OF TREHALOSE IN THE HEMOLYMPH (TREHALOSE IS THE MAJOR CARBOHYDRATE IN THE HEMOLYMPH OF INSECTS).

-!- SIMILARRIY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.

Balol, Chem. Hoppe-Seyler 373:133-142(1992).

C. !- FUNCTION: THIS HORMONE, RELEASED FROM CELLS. IN THE CORPORA CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF DIGITICERIDES FROM THE FAT BOY AND THEN STIMULATES THE FLIGHT MUSCLES TO USE THESE DIGITICENTES TO USE THESE DIGITICES AS AN ENERGY SOURCE.

1- SIMILARITY: BELONGS TO THE ARH / HRTH / RPCH FAMILY.

PIR; $15422.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 26,
